Compressors

Centrifugal Compressor

Core Technology

01 Impeller

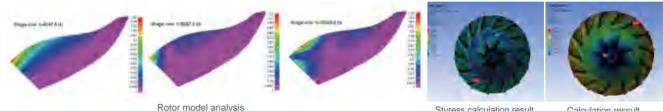

Grid division Model processing

Boundary condition

02 Pneumatic Design Section

The aerodynamic design of Denair centrifugal compressors applies advanced aerodynamic principles, combined with self-developed high-efficiency modeling software, CFD simulation and other means, to ensure optimal inter-stage compression ratio distribution and stable reliability; The long-term product verification design experience, rich impeller database and design software of Denair team ensure the superiority of aerodynamic design.

03 Impeller Strength Analysis –

The finite element analysis software is used to simulate the stress and deformation of the impeller under the design conditions. The results of stress analysis provide a scientific basis for checking the strength of the impeller, prevent accidents due to local stress concentration and insufficient strength of the impeller during the actual operation of the unit. The calculated axial and radial deformations are the values of the gap between the impeller and the inlet cylinder. It provides a reference to prevent the impeller and the intake cylinder from scraping each other when the unit is running, resulting in impeller damage and other major failures.

N4 Rotor Dynamics Design —

Professionally designed rotors and bearings ensure that they can operate under reasonable oil film temperature, pressure and thickness, effectively reducing bearing power consumption. Through extracting the stiffness and damping data from a large number of bearings, DENAIR conduct rotor dynamics analysis to ensure reasonable vibration value of the rotor as well as ensuring the rated speed setting is far away from the critical speed and enhancing the stability of the whole machine.

05 High Reliability Bearing

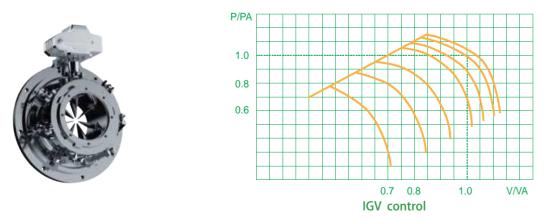

06

Through the professional design of rotor dynamics, the tilting pad bearing with high load capacity and low vibration is adopted. The bearing bush can be automatically adjusted according to the load and temperature changes, so as to ensure the stable operation of the unit under various harsh working conditions.

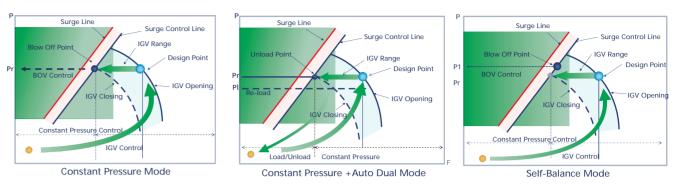

Adopting modular design, the horizontally split gearbox is integrally cast with unlites at all stages while the cooler box is integrally cast design. Compared with the splitted and welded gearbox, compression unit of horizontal one is with higher strength mechanism, fewer processing surfaces, more reliable operation and there is no assembly error, no deformation, low noise and low vibration between the volute and the gear box at all stages. Compared with integral casting, processing, assembly, transportation, on-site installation and maintenance f or our coolers are simpler. When compression unit needs to be returned to the factory for overhaul, the integral casting requires larger lifting equipment and destroys the installation foundation, resulting in secondary installation but ours, which is modular design, perfectly solve this problem.

)7 High Performance IGV —

The electric actuator drives the airfoil stainless steel blades, precisely controls the opening of the inlet guide vanes, changes the pre-swirl value of the intake air, and improves the operating efficiency of the centrifugal compressor. When the compressed air demand is reduced, the IGV can save up to about 9% energy consumption, making the centrifugal compressor run efficiently and energy-saving.

08 Intelligent Control System –

Denair DAC series centrifugal compressor control system can realize three operating modes: full constant pressure mode, automatic dual mode and self-balancing mode. It can intelligently adjust according to the actual operation conditions and gas demand of customers to ensure that the equipment is always in a state of high efficiency, energy saving and stable operation.

09 Control Cabinet –

The highly integrated control cabinet adopts Siemens PLC with touch display screen, which is concise and clear and easy-to-operate. Our controller supports multi-languages switching and all parameters read and displayed in real time, especially key information like running curves and numbers. Meanwhile, automatic alarm, chain shutdown protection, anti-surge and surge prediction functions are available to ensure the safety and reliability of equipment operation.

Quality Control

Denair implements the product concept of "design and development, precision manufacturing, professional assembly, test verification, operation optimization, marketing, efficient service, sustainable development" to realize all-round testing and verification of key design results, such as product aerodynamic design, structural strength, vibration, transmission efficiency, heat exchange, pressure loss and overall machine efficiency, so as to ensure that each product developed has the advanced level of similar products in the world in terms of structure, performance, reliability and ease of use.

Product Application Field -

Denair centrifugal compressors are 100% oil-free and could be custom-made, widely favored in metallurgy, chemical industry, textile, chemical fiber, medicine, automobile manufacturing, aerospace and other industries.

A. Compressed air acts as an oxidation reaction gas

B. Compressed air acts as a power source

C. Refining and production of hydrogen peroxide

A. Pneumatic, instrument, stamping, electroplating, painting, heat treatment and other production lines B. Pneumatic wrench, pneumatic grinder, dust blowing gun, and other end tools C. Protection gas, cooling, dust removal, cleaning

AEROSPACE INDUSTRY

A. Engine Simulation Wind Tunnel

B. High-altitude platform test system

C. Pneumatic component test system

A. Air separation to produce nitrogen, oxygen, etc. B. Used as process instrument gas for iron making,

sintering, steel rolling, etc.

C. As instrument gas for alumina, electrolytic aluminum, lead and zinc smelting, etc.

TEXTILE AND CHEMICAL FIBER INDUSTRY

A. Used for weft insertion in air-jet textiles

- B. Pressurize the roll
- C. As splicing and instrumentation gas

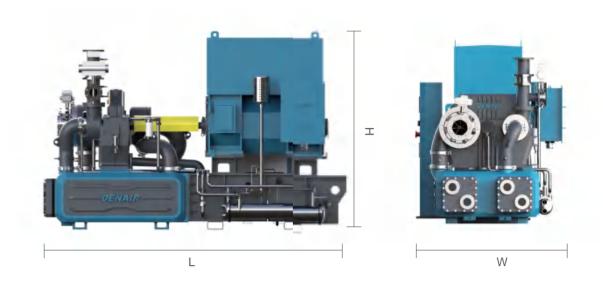

PHARMACEUTICAL INDUSTRY

A. For biological fermentation

B. For chemical raw material production and preparation

Parameter Selection

According to customers' demand , the models with matching flow and pressure can be customized.

DAC50-DAC450

Model	Pressure range(barg)	Flow range (m³/min)	Motor power			Weight
